

DETAILED ACTION

- Applicant's amendment filed on 3/26/2010 has been entered. Applicant has amended claims 1 and 23 and added claim 40. Currently claims 1-2, 6-8, 10-12, 14, 17-19, 21-27 and 29-40 are pending in this application.

EXAMINER'S AMENDMENT

1. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it **MUST** be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Joseph F. Oriti on June 2, 2010.

Application should be amended as follows:

- 1: (Currently Amended) A method of automating generation of a vendor-provided manifest that governs execution of a software object distributed by the vendor, the method comprising:
 - creating, via a computer, a manifest configuration file (MCF) that provides a description of requirements to be embodied in the vendor-provided manifest, the description including an identity of a key file that contains a cryptographic key, wherein providing said identity of the key file eliminates the need to manually insert cryptographic key data into the vendor-provided manifest;
 - parsing the MCF to create a generic representation containing substance specified in the MCF; and
 - providing the generic representation to a manifest generation tool that reads the generic representation, retrieves said cryptographic key to obtain

Art Unit: 2435

cryptographic key data for insertion into the vendor-provided manifest, and generates the vendor-provided manifest in an eXtensible Rights Markup Language (XRML) format based on the requirements, said manifest comprising one or more rules imposed by the vendor to enable a security component to impose a permeable barrier for ensuring integrity of an address space that is used in a computer for executing the software object, the one or more rules incorporating a list of acceptable and unacceptable modules, wherein the acceptable modules are permitted to pass through the permeable barrier and are executed in the address space of the computer and the unacceptable modules are prevented from passing through the permeable barrier and unconditionally barred from being executed in the address space of the computer.

12. (Currently Amended) A computer-readable storage medium encoded with computer-executable instructions to perform a method of generating a manifest that governs the execution of a software object distributed by a vendor, the method comprising:

generating a manifest configuration file (MCF) file containing a high-level description of the manifest using human-readable syntax, wherein the high-level description comprises a vendor-specified policy configured to preclude loading of a rogue module into an address space of a computer in which the software object is to be executed;

parsing the MCF file by eliminating at least a portion of the human-readable syntax to generate a generic representation of the material contained in MCF file; and

generating a manifest based on the generic representation, the generation comprising:

including in said manifest an identification of an executable module and an indication that either:

said executable module may be loaded into said address space; or

said executable module may not be loaded into said address space;

and

providing the generic representation to a manifest generation tool that reads the generic representation and generates the manifest in an eXtensible Rights Markup Language (XRML) format.

17. (Currently Amended) A method of automating the generation of a manifest that governs the execution of a software object, the method comprising:

creating, via a computer, a manifest configuration file (MCF) file using a high-level description containing human-readable syntax that simplifies the describing of the manifest and permits a vendor to specify what may be loaded into an address space of a computer in which the software object is to be executed, the specification referring to one or more components that are external to the software and external to the specification;

parsing the MCF file to generate an internal data structure representing a substance of the requirements with at least a portion of the human-readable syntax removed; and

using a manifest generation tool that accepts the internal data structure and automatically generates therefrom, the manifest, wherein the manifest generation tool does at least one of a) including, in said manifest, data from one of said one or more components; or b) computing a value based on one of said one or more components and including the computed value in said manifest, thereby eliminating the need for the vendor to manually insert the computed value into the manifest; and

providing the substance of the requirements to a manifest generation tool that reads the substance of the requirements and generates the substance of the requirements in an eXtensible Rights Markup Language (XRML) format.

Art Unit: 2435

23. (Currently Amended) A system comprising a processor for generating a manifest, the system further comprising:

a first parser implemented on the processor, the first parser configured to receive a manifest configuration file (MCF) specification in a human-readable syntax indicative of requirements for a manifest, the first parser generating therefrom, a generic representation of said requirements by removing at least a portion of the human-readable syntax, said requirements relating to what may be loaded into an address space of a software object, said specification referring to one or more components external to said software and external to said MCF specification; and

a first manifest generator that generates a manifest based on said representation and includes in said manifest information computed based on, said one or more components, the manifest configured to interoperate with a security component that imposes a permeable barrier for selectively allowing acceptable modules to be loaded into the software space of the software object and blocking unacceptable modules from being loaded into the software space thereby preventing unauthorized tampering of the one or more components; and

providing the generic representation to a manifest generation tool that reads the generic representation and generates the manifest in an eXtensible Rights Markup Language (XRML) format.

Allowable Subject Matter

2. Claims 1-2, 6-8, 10-12, 14, 17-19, 21-27 and 29-40 are allowed.

The following is an examiner's statement of reasons for allowance:

Claims 1 is allowed because the prior art does not teach the combination of limitations as submitted and discussed in the response (see, pages 16-17, against Lao

Art Unit: 2435

reference) filed by applicant on 3/26/2010. Independent claims 12, 17 and 23 have been amended to recite similar limitations for which examiner relied upon Lao to place these independent claims also in condition of allowance. Dependent claims are allowed due to dependency.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to YOGESH PALIWAL whose telephone number is (571)270-1807. The examiner can normally be reached on M-F 9:00 - 5:00 EST.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Kim Vu can be reached on 5712723859. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
